## **For Immediate Release**

# **Ammonia Gas Monitor**

*April 5, 2004* -- The Model 2050 Ammonia Gas Monitors are continuous duty, low cost stationary monitors for detection of high levels (50-500 PPM) of ammonia. These monitors are primarily used in and around freezers, refrigerators, and compressor rooms to warn of leaks and dangerous levels of these gases.

An alarm is activated when the concentration of gas exceeds the user-adjustable level. An alarm condition activates the alarm light on the front of the monitor and generates an output signal. On Models 2050-00 the output signal can activate a remote alarm through one of Sierra Monitor's Alarm Panels. The Model 2102 Dual Channel or Model 2200 Ten Channel Alarm Panels can be connected up to 500 feet from the monitors.

The monitors are housed in a polystyrene enclosure that is suitable for installation in freezer, refrigerator or other applications. Test connections and adjustment controls are located on the outside of the enclosure and are easily used, even when the operator is wearing hand protection.
