Overview
The Infrared (IR) Carbon Dioxide Gas Sensor Module is a smart, network-enabled sensor that provides the interface needed to integrate with a plant-wide control system, whether it requires 4-20 mA, Modbus, HART, relay contacts or SentryBus. This USA-made, stand-alone gas sensor module is loaded with features that will assist in protecting your facility and personnel. As with most gas detectors made by Sierra Monitor, this detector comes with an explosion-proof housing and is ready to manage your gas risk. The 5100-88-IT provides all the built-in features desired by instrumentation and safety professionals, including:

- Modbus RTU RS-485 interface
- 4-20 mA output
- HART Interface
- SMC Sentry digital bus interface
- Optional Integral alarm relays - Alarm, Warning & Trouble
- Aluminum or 316 Stainless Steel enclosure
- Annual calibration frequency
- Interface to multiple protocols
- Integral scrolling LED display

The 5100-88-IT can be used as a 4-20 mA component or as a Modbus RTU node. For higher level system capability the module can interface directly to Sierra Monitor’s Sentry Controller. As part of a Sentry system the user gains capability of system Modbus serial communications, extensive diagnostic features, area and zone alarm management, WebServer interface and multiplexing sensor connections.

How It Works
Carbon Dioxide absorbs infrared light energy at defined wavelengths, providing an absorption signature for CO2. The principle of an infrared detector is based upon the absorption of the infrared light at a specific wavelength as it passes through the gas. The more of the absorbing gas that is present, the more light is absorbed. The detector measures the energy from an infrared light beam at a wavelength that is absorbed by the gas and compares it to the energy emitted by the source. The difference in energy received by the detector indicates the level of gas in the atmosphere.
